

Fear of Temperature: Conceptual and Heritage Feasibility Review for a Master Research Thesis

Executive verdict and object definition

Executive verdict: GO WITH MAJOR REFRAMING.

The project is academically viable only if it abandons the proposition that fear itself is inherently cultural heritage. Its defensible object is the historically situated process through which records, representations, vocabularies, practices and institutions have made rising temperature emotionally intelligible, socially memorable, preservable and, in some cases, heritage-valued.

One-sentence object definition

A bounded corpus of records, representations and community practices through which rising temperature has been emotionally interpreted, circulated, remembered and curated, examined for evidence of heritage-making rather than presumed to constitute heritage.

This distinction is decisive. Critical Heritage Studies treats heritage less as an intrinsic property of old objects than as a cultural process of selecting, valuing, narrating and using the past. UNESCO's intangible-heritage framework likewise requires recognition by communities, groups or individuals, while the Council of Europe's Faro framework stresses that objects matter because of the meanings, uses and values attached to them. Documentary and digital heritage frameworks add requirements such as enduring significance, provenance, preservation and accessibility. None of these frameworks supports a unilateral declaration that all records of climate fear—or “fear” as an abstract emotion—are heritage. ¹

The strongest argument in favour is that societies do not encounter temperature only through thermometers. They encounter it through threshold numbers, maps, headlines, forecasts, political speeches, family stories, protest images, warnings, memorial practices and adaptation routines. When such forms are selected, repeatedly reused, connected to collective identity, transmitted, contested and preserved, they may become resources through which later publics remember how earlier societies understood environmental danger. The heritage object would therefore be the socially organised record and afterlife of climate-related meaning, not a decontextualised psychological state. The argument is consistent with process-based heritage theory, documentary-heritage policy, cultural-memory theory and scholarship on affective heritage practice. ²

The strongest counterargument is that the project may manufacture the phenomenon it claims to discover. By assembling temperature data, media content, survey instruments, art, slogans and personal testimony under the title *Fear of Temperature*, the researcher could retrospectively impose emotional unity and heritage value on materials that their creators and custodians never regarded as related, affective or patrimonial. High circulation, political urgency, visual recognisability and inclusion in a new database would then be mistaken for heritage. This is the central threat of **heritage inflation**: an archive created for research can have scholarly value without proving that its contents already

possess socially grounded heritage value. Critical discussion of heritagisation has explicitly warned against conceptual conditions in which almost everything becomes heritage. ³

The defensible thesis is therefore not:

Fear of rising temperature is humanity's cultural heritage.

It is:

Certain records and practices through which rising temperature has been emotionally understood may undergo heritage-making, and those processes can be empirically investigated.

The thesis must remain capable of reaching a negative result. It should be possible to conclude that a highly visible item is only a scientific record, media artefact, research instrument or short-lived communication device; that a particular heritage claim lacks community legitimacy; or that the proposed digital archive creates archival significance without documenting pre-existing heritage value.

Terminology and semantic taxonomy

Climate and temperature concepts

These terms describe different levels of physical measurement, climatic process, impact, policy framing and public rhetoric. They must not be treated as synonyms.

Term	Working definition	Semantic and methodological role
Temperature	A measured physical property describing thermal state at a specified place, medium, time and scale.	A measurement variable, not an affective or heritage category. Every use should identify what is measured: air, land surface, ocean, indoor environment, apparent temperature or another quantity.
Rising temperature	An observed, modelled or projected increase in temperature across a stated period, geography and metric.	An incomplete expression unless baseline, timescale, spatial scale and uncertainty are stated. It may refer to a local trend, seasonal trend, global mean or a single event, which are not interchangeable.
Global warming	The long-term increase in global mean surface temperature, especially in the modern anthropogenic context.	A physical trend within the broader phenomenon of climate change. It does not encompass every climatic effect.
Climate change	Persistent change in the state and variability of the climate system over extended periods.	Broader than warming: it includes changes in precipitation, extremes, circulation, sea level and other interconnected systems. It should not be reduced to daily weather or temperature alone.

Term	Working definition	Semantic and methodological role
Climate crisis	An evaluative and political framing that presents climate change as a severe, systemic and urgent condition.	A communication frame, not a meteorological variable. Its adoption and contestation can be studied as public discourse.
Climate emergency	A stronger urgency frame, sometimes formalised through declarations by governments, institutions or organisations.	It can function simultaneously as political language, institutional declaration and mobilisation strategy. Research must distinguish declarations from scientific measurements and from audience responses.
Extreme heat	Heat conditions that are unusually severe or dangerous relative to local climatology, exposure and health vulnerability.	A hazard category. Relevant thresholds can depend on humidity, nighttime temperature, duration, acclimatisation, housing, labour and public-health capacity.
Heatwave	A sustained period of unusually hot conditions, usually defined relative to local climatology and often involving successive hot days and nights.	An event category, not a universal absolute temperature. WMO emphasises accumulated excess heat and the importance of warm nights, while official warning definitions vary by national and local authority. ⁴
Temperature anomaly	The difference between an observed temperature and a specified baseline average.	A comparative statistical quantity. The reference period is constitutive of the result and must be preserved in metadata. A +1°C anomaly is not an absolute temperature of 1°C. ⁵
Warming threshold	A reference level used to organise scientific assessment, policy, risk or health action.	Global 1.5°C and 2°C levels concern long-term global mean warming relative to a defined historical baseline. Local dangerous-temperature thresholds concern immediate exposure and health risk. They cannot be placed on the same numerical scale without explaining their different spatial, temporal and physiological meanings.

The semantic structure should be represented as follows:

Measurements produce temperature observations.

Observations are converted into **anomalies, trends and modelled projections**.

Long-term global trends support the concept of **global warming**, which is one component of **climate change**.

Particular exposures may be classified as **extreme heat or heatwaves**.

“Crisis” and “emergency” are **interpretive and political framings** of those conditions.

Thresholds such as 1.5°C, 2°C and local heat-warning values organise **different scales of risk and decision-making**.

This distinction is especially important for the archive interface. A photograph of a 45°C street thermometer, a global +1.5°C warming threshold and a monthly +1.5°C anomaly may contain the same

numeral but refer to fundamentally different phenomena. Collapsing them into a single “temperature fear” index would be scientifically invalid and rhetorically misleading.

Emotion, cognition, attention and rhetoric

Climate-emotion research already contains substantial conceptual instability. “Climate anxiety,” “eco-anxiety,” “worry,” “distress” and “concern” are operationalised differently across studies, and validated scales measure partially different constructs. Pihkala’s taxonomy, the Climate Change Anxiety Scale and the Hogg Eco-Anxiety Scale are useful precisely because they demonstrate that climate-related affect is multidimensional rather than reducible to fear. ⁶

Concept	Primary category	Required distinction
Fear	Emotion	Usually oriented toward an apprehended danger or threat. It may be momentary, recurring or culturally patterned. Evidence that a text uses threatening language is not evidence that audiences felt fear.
Worry	Repetitive cognition with emotional valence	Involves recurring thoughts about uncertain adverse outcomes. It may coexist with planning and responsibility and need not imply dysfunction.
Anxiety	Anticipatory affective-cognitive state	Often concerns diffuse, uncertain or future threat. It ranges from adaptive vigilance to impairing symptoms; the thesis must not infer pathology from ordinary concern.
Climate anxiety	Domain-specific construct	Anxiety associated specifically with climate change and its consequences. It is operationalised differently across studies and should be tied to an explicit measure or qualitative definition.
Eco-anxiety	Broader domain-specific construct	Concern or anxiety regarding environmental deterioration, potentially including biodiversity loss, pollution and ecological disruption beyond climate change. It is broader than climate anxiety.
Concern	Evaluative orientation	A broad judgement that an issue is important, serious or worthy of attention. It is often used in surveys but is not equivalent to fear or anxiety.
Dread	Anticipatory emotion	A sustained aversive anticipation of severe or difficult-to-control consequences. It can be analysed as affect but should not be inferred merely from catastrophic vocabulary.
Distress	Umbrella negative state	May include emotional discomfort, somatic burden or impaired functioning. It requires evidence beyond agreement that climate change is dangerous.
Perceived risk	Cognitive-affective appraisal	A judgement about probability, severity, personal relevance, uncertainty or controllability. It can correlate with emotion but is not itself an emotion.

Concept	Primary category	Required distinction
Perceived threat	Appraisal	A judgement that something may harm valued persons, places, identities or systems. Threat appraisal can precede fear, anger, action or denial.
Issue salience	Public or individual attention	The prominence or perceived priority of an issue. High salience does not show fear, agreement or heritage value.
Panic	Acute behavioural-affective state	An intense, potentially disorganising response. It should not be used as a synonym for public concern, urgent communication or political mobilisation.
Moral panic	Sociological analytical claim	A disputed interpretation of collective reaction in which actors, media and institutions construct a threatening condition or group as a major social danger. It is not a clinical diagnosis and generally requires analysis of amplification, disproportionality, authority and social control.
Alarmism	Rhetorical and political label	A term used to accuse speakers of exaggerating danger. It is not a neutral measurement category. The thesis should study who applies the label, to whom, under what standards of evidence and with what political effects.
Helplessness	Functional or motivational state	A perceived inability to influence an outcome. It may follow high threat combined with low efficacy but cannot be inferred from sadness or worry alone.
Anger	Emotion	Often associated with blame, injustice and agency. It may motivate action rather than paralysis.
Grief	Emotion and process of loss	May concern experienced, anticipated or culturally mediated ecological loss. Ecological grief scholarship connects climate disruption to losses of places, species, practices, livelihoods and anticipated futures. ⁷
Hope	Future-oriented emotion or orientation	Can be constructive, defensive, passive or critical. It should not be treated automatically as the desirable opposite of fear.
Efficacy	Belief or appraisal	Includes perceived personal or collective capacity to act and belief that an action will be effective. Fear-appeal research shows why threat and efficacy must be analysed separately. ⁸

A defensible causal vocabulary is therefore:

Hazard information may affect **risk and threat appraisals**.

Appraisals may elicit **fear, worry, anxiety, anger, grief, hope or other emotions**.

Emotions interact with **efficacy, identity, trust and social norms**.

These interactions may produce **attention, avoidance, mobilisation, adaptation, denial or helplessness**.

Media salience and circulation may influence any of these processes but do not prove them.

The archive should never assign emotional labels solely by keyword. A newspaper headline saying “climate panic” may be criticising environmentalists rather than documenting panic. A protest slogan saying “act now” may express anger, duty, grief, hope or strategic urgency. Audience emotion requires separate evidence, such as interviews, letters, surveys, reception records or interpretive analysis that acknowledges uncertainty.

Heritage, memory and heritage-making concepts

Concept	Status	Relevance to the project
Cultural heritage	Formal international and national policy/legal family; also an academic concept	A broad category covering culturally valued tangible and intangible inheritances. It is not a residual category for anything culturally interesting.
Documentary heritage	Formal UNESCO normative framework	Documents or documentary collections may qualify when they possess significant and enduring value. Preservation, authenticity, integrity, access, provenance and risk are central. ⁹
Digital heritage	Formal UNESCO normative framework	Digital resources may have lasting cultural, educational, scientific or administrative value. The category concerns selection, continuity, accessibility and preservation, not every digital object. ¹⁰
Intangible cultural heritage	Formal category under UNESCO’s 2003 Convention	Practices, representations, expressions, knowledge and skills recognised by communities, groups and, in some cases, individuals, and recreated and transmitted over time. A transient emotion does not satisfy this definition by itself. ¹¹
Living heritage	UNESCO programmatic language and academic approach	Commonly used to emphasise the continuing practice, recreation and transmission of intangible heritage. It is not a separate universal legal category from ICH.
Difficult heritage	Academic analytical concept	Heritage associated with troubling, shameful, violent or identity-disrupting pasts. Climate records are not automatically “difficult heritage”; the term applies only where inheritance creates sustained social difficulty or moral conflict. ¹²
Contested heritage	Academic and professional analytical concept	Heritage whose meaning, ownership, interpretation or preservation is actively disputed. Controversy about climate science alone does not make every climate record contested heritage.

Concept	Status	Relevance to the project
Affective heritage	Academic analytical framework, not a formal UNESCO or Council of Europe category	Describes how emotion and affect participate in heritage practice, commemoration, interpretation and attachment. It should be used to analyse affect in heritage-making, not to invent a new official class of “emotional heritage.” ¹³
Environmental heritage	Variable policy and academic usage	May refer to natural, cultural or hybrid inheritances involving environments and human–environment relations. It lacks one uniform international definition equivalent to the UNESCO ICH category.
Cultural memory	Academic concept	Socially organised memory maintained through symbols, institutions, texts, rituals and media over time. It is useful for examining transmission and reuse, but it should not be treated as a container shared identically by all members of a society. ¹⁴
Collective memory	Academic sociological concept	Memory formed and reconstructed in social frameworks. It does not mean a literally uniform group mind. ¹⁵
Archival memory	Academic and professional analytical concept	The remembered past as shaped by appraisal, description, preservation, access and omission. Archives produce conditions for memory but do not neutrally contain the whole past.
Heritagisation / heritage-making	Academic analytical concept	The processes through which objects, records, places or practices are selected, valued, narrated, protected, transmitted and governed as heritage. It is the project’s most useful central concept.
Authorised Heritage Discourse	Critical Heritage Studies concept	Smith’s term for dominant professional and institutional assumptions that privilege expert authority, material monumentality, age and consensus. It helps analyse who is empowered or excluded when climate records are collected. ¹⁶
Heritage community	Formally articulated in the regional Faro Convention; also used analytically	A group of people who value aspects of heritage and seek to sustain and transmit them. The concept supports participatory authority but should not be romanticised: communities are internally diverse and unequal. ¹⁷

Concept	Status	Relevance to the project
Provenance	Formal archival and collection-management principle	Documentation of origin, custody, context, transformations and relationships. A decontextualised screenshot or downloaded visualisation has weak provenance even when its content is famous.
Preservation	Formal professional practice	Active measures that maintain authenticity, intelligibility, accessibility and usability over time. Saving a file once is not a preservation strategy.
Transmission	Formal ICH term and academic memory concept	Passing practices, meanings, knowledge or records between participants and generations. Download counts do not demonstrate transmission.
Reuse	Documentary/digital heritage and memory concept	Subsequent citation, adaptation, exhibition, teaching, commemoration or mobilisation. Reuse can provide evidence of social afterlife but may also decontextualise or contest an object.
Commemoration	Academic and institutional practice	Publicly organised remembrance through ceremonies, exhibitions, anniversaries, monuments, media or ritual. Not every act of recall is commemoration.

Formal-framework conclusion: “Affective Heritage” is not an officially recognised UNESCO heritage category. It is a theoretical framework for studying how emotions, embodied responses, attachments and affective practices participate in encounters with the past. Calling a collection “affective heritage” cannot substitute for evidence that an object or practice has been valued, preserved, transmitted or recognised. ¹⁸

Formal instruments also have different authority. UNESCO conventions establish formal international treaty frameworks for participating states; UNESCO recommendations and charters are normative instruments; ICOM, ICA and IFLA documents provide professional standards and guidance; and academic terms such as AHD, affective heritage and difficult heritage are interpretive tools rather than legal designations. ICOM’s current museum definition explicitly combines collection and conservation with ethical, inclusive and community-participatory practice, reinforcing the point that institutional custody is important but not sufficient by itself. ¹⁹

Heritage eligibility matrix

The following classification is a **default starting status**, not a permanent ontological label.

Class definitions

Class	Meaning
Scientific evidence only	Primarily produced to measure, model or establish physical conditions.
Historical source	Can support research into a period, event, institution or discourse.
Cultural record	Records meaning-making, representation, communication or social practice.
Heritage candidate	Has plausible but not yet fully demonstrated heritage value.
Community- or institutionally recognised heritage	Has documented recognition, preservation and governance beyond the researcher's selection.
Not suitable for inclusion	Lacks relevance, provenance, lawful access, ethical legitimacy or sufficient context.

An object may occupy more than one category. A temperature ledger can be scientific evidence, a historical source and, following institutional appraisal and sustained recognition, documentary heritage. The categories should therefore be represented as pathways rather than mutually exclusive boxes.

Candidate object	Default classification and heritage pathway	Conditions, authority and risks
Raw temperature observations and meteorological instrument records	Usually scientific evidence and historical sources . Unique observation books, station records or instruments may become documentary, scientific or institutional heritage candidates .	Heritage value requires rarity or representativeness, documented provenance, evidential integrity, historical significance, institutional appraisal or recognised community meaning. Meteorological agencies, archives, historians, instrument custodians and affected communities may make different claims. Digitised values should remain linked to original units, methods, calibration and station histories.
Global temperature datasets and climate models	Primarily active scientific infrastructures , not heritage by default. Historical versions, code, documentation and model lineages may become digital or documentary heritage candidates .	Preservation should distinguish live datasets from versioned historical snapshots. Selection requires evidence of scientific or cultural significance, software dependencies, licences and reproducibility. A famous graph does not make the entire underlying dataset heritage.

Candidate object	Default classification and heritage pathway	Conditions, authority and risks
Early scientific papers	Historical sources and scientific records; selected works may become heritage candidates .	Pivotal influence, rarity, provenance, citation afterlife, institutional collection and public reinterpretation may support value. "Early" must be defined relative to the case. Copyright and database access apply.
IPCC, WMO, UNEP and government reports	Official documentary records and historical sources ; they may also be cultural records of institutional language and policy. Selected series can become documentary heritage candidates .	Preservation of editions, drafts, consultation records and translations may be more revealing than storing final PDFs alone. Institutional authority does not automatically confer heritage value, although formal custody and repeated use strengthen a claim.
News reports and newspaper front pages	Cultural records and historical sources. Selected items may become heritage candidates when they acquire sustained symbolic or commemorative afterlives.	Newspaper volume is not heritage value. Selection needs a documented sampling frame, evidence of reuse or significance, publication context and rights clearance. English-language prestige newspapers must not stand in for global public culture.
Television weather forecasts and documentaries	Audiovisual cultural records . Landmark broadcasts, recurring formats or collections may become heritage candidates .	Relevant evidence includes routine repetition, public recognition, technological change, distinctive warnings, archival custody and use in later retrospectives. Broadcast copyright, performer rights and incomplete station archives are major constraints.
Temperature curves, heat maps, warming stripes and climate spirals	Scientific-public visual cultural records . Some may become strong heritage candidates because of repeated adaptation, public recognition and symbolic reuse.	The warming stripes and climate spiral illustrate how data visualisations can circulate beyond science into education, art, protest and public identity; that circulation supports study of heritage-making but does not by itself establish recognised heritage. The archive must preserve data source, baseline, version, designer, licence and adaptations. ²⁰
Political speeches	Official historical sources and rhetorical cultural records .	Heritage candidacy depends on sustained citation, institutional preservation, commemorative use, community significance or importance in a documented policy transition. Political prominence alone is insufficient.

Candidate object	Default classification and heritage pathway	Conditions, authority and risks
School textbooks	Educational cultural records and historical sources of authorised knowledge. Longitudinal textbook series may become documentary heritage candidates .	Analyse editions, curriculum context, images, exercises, language and regional differences. Rights are usually held by publishers. Textbooks can reproduce national and institutional bias rather than general public memory.
Films, literature, music, advertising and artworks	Cultural works and cultural records ; some are already recognised through artistic, institutional or community heritage processes.	Inclusion must be selective and analytically connected to temperature, heat or warming. Heritage value may be assigned by creator communities, audiences, critics, collecting institutions or cultural authorities, but the researcher should document rather than assume it. Copyright, moral rights and Indigenous cultural and intellectual property may apply.
Public-opinion surveys and original questionnaires	Research evidence and historical sources. Survey series can become documentary heritage candidates as records of changing public categories.	Survey responses do not transparently reveal emotion: wording, sampling, language and measurement context matter. Original microdata may contain sensitive personal information. Preservation requires consent compatibility, anonymisation, data dictionaries and versioning.
Climate-anxiety scales	Scientific instruments and historical sources in the development of psychological categories.	The scale itself may become a cultural record of how climate affect was operationalised. It is not evidence that populations were anxious unless appropriately administered. Cross-cultural validation, construct validity and licensing must be addressed. ²¹
Environmental-organisation and movement posters, slogans, photographs and video	Strong cultural records and often community-archive candidates .	The strongest authority lies with movements, creators, participants and community archives rather than with an external researcher. Evidence of internal preservation, anniversary reuse, oral testimony and identity strengthens heritage claims. Risks include surveillance, exposure of activists, copyright and extraction of movement histories.

Candidate object	Default classification and heritage pathway	Conditions, authority and risks
Terms such as “climate emergency,” “last chance” and “boiling planet”	Individual terms are discourse traces, not freestanding heritage objects. Corpora, declarations, editorial policies and documented histories of use may be cultural records .	Study semantic adoption, translation, contestation and reuse. “Climate emergency” is a framing whose consequences require empirical study; it cannot be coded automatically as fear. ²²
Arguments about “alarmism” or “climate panic”	Historical and rhetorical cultural records .	Valuable for studying boundary work around legitimate concern. Inclusion should cover competing positions and evidentiary standards, not reproduce “alarmism” as the researcher’s diagnosis.
Social-media posts, hashtags and memes	Ephemeral digital cultural records ; carefully selected collections may be digital-heritage candidates .	Public accessibility is not equivalent to ethical consent for permanent archiving and republication. Context collapse, deleted posts, pseudonymity, platform terms, minors, harassment and algorithmic sampling require strict governance. Aggregate analysis, paraphrase, restricted access and consent-based contributions should be preferred. Contextual-integrity scholarship is directly relevant. ²³
Personal diaries, oral histories and family memories	Personal historical sources and potentially strong community heritage candidates .	Heritage value depends on consent, continuing family or community meaning, use, transmission and governance. An oral history commissioned by the project initially has researcher-created archival significance ; it becomes community-recognised heritage only through subsequent recognition and use. Contributors need control over identification, access, withdrawal and future reuse.
Heatwave community mutual aid and adaptation practices	Contemporary social practices; potentially living-heritage candidates only where communities recognise, recreate and transmit them.	Emergency coping should not be romanticised as tradition. Evidence might include recurring heat-check systems, cooling-centre knowledge, building practices, intergenerational care or community protocols that participants themselves value and sustain. UNESCO’s ICH criterion of community recognition is essential. ¹¹

Candidate object	Default classification and heritage pathway	Conditions, authority and risks
Museum, library, archive and community-organisation collections	Institutionally appraised collections may already possess recognised documentary or cultural heritage status .	Institutional collection supplies strong heritage-making evidence, but institutions can reproduce authorised, colonial and metropolitan priorities. Community catalogues, acquisition histories, collection gaps and refusal to collect are themselves research data. ICOM stresses ethical operation and community participation. ²⁴
The proposed database and participation platform	A research-created digital archive or prototype , not heritage at the time of creation.	It may support future heritage-making by documenting provenance, contested interpretation, community claims and reuse. Its existence, traffic or interface does not confer heritage status on itself or its contents. Long-term preservation, governance, selection policy, exit strategy and institutional deposit are required.
Undifferentiated web scrapes, decontextualised screenshots, private posts, fabricated metadata or materials without lawful access	Not suitable for inclusion.	Lack of provenance, consent, contextual integrity or legal authority is not cured by research interest. Indigenous materials lacking appropriate community authority should also be excluded, restricted or governed by the relevant peoples.

Who may assign heritage value?

No actor possesses exclusive universal authority. Different actors can make different kinds of heritage claims:

- **Communities, families, movements and knowledge holders** can identify meanings, identity relationships, desired transmission and culturally legitimate restrictions.
- **Creators and custodians** can establish provenance, intended use and conditions of access.
- **Archives, libraries and museums** can appraise, collect and preserve under professional and legal mandates.
- **States and international bodies** can establish formal recognition within specific instruments.
- **Researchers** can analyse, compare and make reasoned heritage claims, but cannot manufacture community recognition merely by selecting an item for a database.

The Faro Convention's heritage-community approach and UNESCO's ICH framework both make social valuation and transmission central, while documentary heritage permits institutional appraisal of records whose enduring evidential or cultural significance may exceed a single self-identified community. These should be treated as complementary but distinct pathways. ²⁵

Community recognition is therefore not required in exactly the same way for every heritage type. It is indispensable for claims about living or intangible community heritage. For documentary heritage,

institutional appraisal, enduring evidential value and public significance may be sufficient for a defensible heritage claim, although community participation remains ethically and interpretively important. Institutional custody is neither necessary for all heritage nor sufficient proof of legitimate heritage value.

Heritagisation test and formal recognition

Purpose of the test

The proposed test is not a machine for producing heritage. It is a structured method for identifying what evidence exists, what remains speculative and whose authority is being invoked. It should be applied to individual objects, collections and practices, not to “climate fear” as a totality.

Each dimension can be recorded as:

- **Absent or contradicted**
- **Plausible but weakly evidenced**
- **Substantially evidenced**

Scores may support comparison, but **the dimensions should not be summed into an automatic heritage threshold**. A high total cannot compensate for fabricated provenance, unethical acquisition or absence of any valuing constituency.

Dimension	Operational question	Acceptable evidence	What does not count by itself
Historical significance	Does the object illuminate a consequential development, transition, event or long-term practice?	Documented relationship to a change in science, policy, culture, community life or representation.	Age, fame or political importance alone.
Evidential value	What can the object reliably demonstrate that other sources cannot?	Original records, methods, context, corroboration, completeness or unique testimony.	Assertions detached from provenance.
Cultural meaning	What meanings have identifiable actors attached to it?	Interviews, curatorial texts, community accounts, adaptations, annotations and reception records.	Researcher interpretation alone.
Social circulation	Has it moved among institutions, media, communities or practices?	Documented publication, exhibition, teaching, sharing or adaptation.	Raw view counts or virality alone.

Dimension	Operational question	Acceptable evidence	What does not count by itself
Community recognition	Do relevant participants explicitly value, maintain or identify with it?	Community decisions, collection activity, interviews, recurring use, governance or safeguarding practices.	A researcher-created focus group agreeing that it is "interesting."
Institutional recognition	Has an archive, library, museum, school, government or professional body appraised or preserved it?	Acquisition, catalogue status, preservation plans, exhibition, formal registration or mandated custody.	Being stored on an organisational server.
Temporal persistence	Does meaning or use persist beyond a brief communication cycle?	Evidence across multiple periods, anniversaries, generations or phases of public debate.	A short burst of media attention.
Repeated reuse	Is it cited, adapted or reactivated in later contexts?	Reprints, remixes, classroom use, protest reuse, exhibitions, retrospective media or commemoration.	Automated reposting without evidence of meaning.
Intergenerational transmission	Has it passed between age cohorts or been maintained for future recipients?	Family transmission, training, curricular continuity, youth participation or community succession.	A future-oriented preservation aspiration by the researcher.
Identity or collective-memory relationship	Does it help a group narrate who it is, what it experienced or what it owes the future?	Identity narratives, oral histories, ceremonies, community archives and durable public references.	General relevance to "humanity."
Contestation	Are its meaning, ownership, credibility or preservation disputed?	Competing interpretations, counter-archives, refusal, removal, protest, legal conflict or debate.	Mere online disagreement. Contestation can add analytical importance but does not automatically add heritage value.
Preservation risk	Is the object vulnerable to loss, obsolescence, environmental damage or institutional neglect?	Format risk, platform closure, deteriorating media, fragile custody or endangered practice.	Urgency alone. Risk of loss cannot create value where none is demonstrated.

Dimension	Operational question	Acceptable evidence	What does not count by itself
Provenance quality	Are origin, custody, dates, versions, transformations and relationships documented?	Original files, accession records, metadata, checksums, source histories, interview documentation and version control.	Unverified screenshots or copied fragments.
Ethical legitimacy	Is collection, description, access and reuse lawful and culturally legitimate?	Consent, appropriate authority, rights review, cultural protocols, benefit sharing and withdrawal procedures.	“Publicly available,” open technical access or academic purpose alone.

Separate decision states

Heritage eligibility means that an object or practice possesses enough significance, provenance and ethical legitimacy to be considered within a heritage inquiry. It does not mean anyone has actually claimed it as heritage.

Heritage claim exists when an identifiable actor—community, institution, state, movement, family, professional group or researcher—asserts that the object should be sustained, transmitted or protected because of inherited or future-oriented value.

Heritage-making evidence consists of observable practices such as selection, collection, cataloguing, narration, commemoration, conservation, repeated reuse, teaching, adaptation, restriction, restitution or transmission.

Recognised heritage requires sustained evidence beyond the thesis: community recognition, institutional appraisal, formal designation, continuing custodianship or some defensible combination of these.

Researcher-created archival significance is the value produced by assembling a corpus, constructing metadata, recording testimony or enabling comparison. This is legitimate scholarship, but it must be labelled accurately. It demonstrates the significance of a research archive, not necessarily the heritage status of its subject.

Mandatory gates

An object cannot proceed to a strong heritage claim if:

1. provenance is materially unreliable;
2. acquisition or reuse lacks ethical legitimacy;
3. no actor other than the researcher can be shown to value, preserve, transmit or reuse it;
4. the only evidence is popularity, political prominence or media volume;
5. the claimed community is invented at an abstract scale, such as “humanity,” without empirical representation;
6. the researcher’s platform is the first and only site at which the materials are related to one another.

Two pathways should then be distinguished.

Documentary and digital pathway: significance, enduring evidential or cultural value, provenance, integrity, preservation need, accessibility and recognised custodianship are primary. UNESCO's documentary and digital frameworks are the central standards. ²⁶

Living and community pathway: community recognition, active practice, recreation, identity, continuity and transmission are primary. UNESCO's ICH framework is the controlling reference; expert enthusiasm cannot replace community recognition. ¹¹

Applying the test to representative examples

A raw global-temperature dataset has exceptional scientific and evidential value, strong provenance and institutional recognition, but may have little direct relationship to identity, cultural transmission or affective meaning. It is scientific and documentary material; a heritage claim would need to concern its historical version, institutional lineage, scientific significance or cultural use rather than its numerical content alone.

A widely reused warming-stripes image has scientific provenance, cultural circulation, adaptation and possible symbolic recognition. It is a strong cultural-record and heritage-candidate case. Whether it constitutes recognised heritage depends on evidence of sustained collection, transmission and attachment, not on the number of times it was shared. ²⁷

A community's recurring heatwave mutual-aid practice may have limited documentary form but strong community recognition, continuity, identity and transmission. It could enter a living-heritage pathway if participants themselves wish to sustain and describe it in those terms. It should not be designated from outside merely because it appears socially valuable.

A hashtag collected during one heatwave may possess high circulation and short-term evidential value but weak persistence, uncertain representativeness, fragile provenance and serious privacy concerns. It should ordinarily remain a digital cultural record, not heritage.

An oral history created by the project has high research and archival value when consent and provenance are sound. Its heritage status remains open. The interviewee, family, community and future custodians—not the interview's mere existence—determine whether it develops a transmitted heritage role.

Counterarguments, ethics, and representation

Examiner-level objection	Severity	Response and required modification	No-go condition
Fear is a short-term psychological state, not heritage.	High	Accept the premise in part. Study material traces, narratives, repertoires, institutions and practices through which emotions are interpreted and remembered. Do not designate a private state as heritage.	No-go if the thesis continues to make "fear itself" the heritage object.

Examiner-level objection	Severity	Response and required modification	No-go condition
The project turns every public record into heritage.	Critical	Use the eligibility matrix and heritagisation test; include negative cases and explicitly classify materials as evidence, source, cultural record or candidate.	No-go if inclusion in the database is treated as proof of heritage.
The researcher is inventing heritage without community authority.	Critical	Distinguish researcher claims from community and institutional claims. Document who values an object, who rejects the designation and who controls it. Co-design collection policy where communities are implicated.	No-go if no external valuing constituency or custodial practice can be identified for the principal case.
This is only a repository for climate-communication materials.	High	Make the thesis a study of selection, valuation, reuse, preservation and contestation. The platform must be a research instrument or output, not the research question. Compare preserved and unpreserved materials.	No-go if the principal result is a website without an analytical argument, method or falsifiable findings.
“Global fear” is a Western, English-language and media-elite construction.	Critical	Abandon “global human fear” unless the research becomes genuinely multilingual, comparative and locally governed. A Master thesis should use one bounded jurisdiction or two carefully matched cases.	No-go for universal claims based chiefly on English media, international organisations and Western survey scales.
Fear, worry and concern cannot be directly translated across languages.	High	Use emic terminology, translation notes, bilingual coding and qualitative semantic analysis. Do not assume lexical equivalence or pool survey results without measurement-invariance evidence.	No-go for direct cross-language rankings of “fear” without construct-validation work beyond normal Master scope.
Reasonable risk perception is being pathologised as anxiety or panic.	High	Separate risk judgement, concern, worry, anxiety, distress and functional impairment. Avoid diagnostic language unless using validated instruments within an approved psychological study.	No-go if support for climate action or belief in serious risk is coded as pathology.

Examiner-level objection	Severity	Response and required modification	No-go condition
The study confuses real climate danger with media representation.	High	Maintain a two-layer model: physical hazard and scientific evidence on one side; representation, reception and heritage-making on the other. Analyse relationships without reducing one to the other.	No-go if discourse analysis is used to judge whether the physical risk is real or if scientific evidence is treated as direct evidence of emotion.
The archive may intensify catastrophism, numbness or helplessness.	Medium-high	Include a range of affective and action repertoires—fear, care, anger, grief, efficacy, adaptation and hope—and evaluate user responses. Display uncertainty and action context rather than decontextualised catastrophe.	No-go if the interface intentionally maximises distress, uses manipulative fear appeals or exposes vulnerable contributors to foreseeable harm.
The project heritagises a phenomenon too early.	High	Study “heritage-making in the present,” prospective collecting and emerging heritage claims. Use “candidate,” “record” and “archive” more often than “heritage.” Contemporary collecting has archival precedents, but current preservation does not settle future heritage status.	No-go if present urgency is presented as equivalent to enduring value or intergenerational transmission.
Social-media preservation violates contextual privacy.	Critical	Minimise scraping, avoid republishing identifiable content, assess platform context, use aggregation or paraphrase, and offer consent-based contribution pathways. Public visibility is not blanket permission for permanent archival exposure. ²³	No-go for identifiable republication of sensitive, deleted, minor-authored or vulnerable-user content without defensible consent or legal authority.
Indigenous and Global South knowledge may be extracted and reclassified.	Critical	Indigenous knowledge must be governed through Indigenous authority, data sovereignty, cultural protocols and benefit. CARE principles require Collective Benefit, Authority to Control, Responsibility and Ethics. “Open heritage” must not override the right to restrict knowledge. ²⁸	No-go for inclusion of Indigenous knowledge or testimony without appropriate community governance, authority over metadata/access and a right to refuse or withdraw.

Examiner-level objection	Severity	Response and required modification	No-go condition
Institutional collections reproduce authorised heritage discourse.	High	Treat collecting institutions as research subjects rather than neutral validators. Compare national institutions with community archives and examine acquisition gaps, catalogue language and archival silences.	No-go only if institutional recognition is the sole criterion and community absences are ignored.
The title predetermines the answer.	High	Retain <i>Fear of Temperature</i> as a provocative working title only if the subtitle and research design explicitly problematise “fear.” Consider a less determinative final title.	No-go if all materials are selected because they fit a predetermined narrative of fear and counter-evidence is excluded.

Archival silences

The corpus will inevitably represent what was recorded, preserved, digitised, catalogued and made searchable. This creates at least four layers of silence:

1. experiences never documented;
2. records destroyed, discarded or inaccessible;
3. material preserved but poorly described or undigitised;
4. material excluded by the project’s language, platform or selection criteria.

Archival-silence scholarship treats these absences as outcomes of power, appraisal and historical production rather than as empty spaces that can simply be filled. Community archives can challenge dominant omissions, but they should not be romanticised as internally complete or conflict-free. ²⁹

Copyright and cultural ownership

The project would encounter different rights regimes:

Material	Principal concern
Newspapers, broadcasts, film, music, advertisements and art	Copyright, performers’ rights, moral rights, licensing and limits on online display.
Scientific datasets and visualisations	Data licences, attribution, software licences, version integrity and restrictions on derivative works.
Surveys	Participant consent, confidentiality, re-identification risk, instrument copyright and secondary-use conditions.
Oral histories and diaries	Copyright in testimony, privacy, defamation, future use, withdrawal and family/community interests.

Material	Principal concern
Social media	Platform terms, contextual privacy, authorship, deletion, minors and permanent exposure.
Movement archives	Creator rights, participant safety, surveillance risk and collective ownership.
Indigenous knowledge	Indigenous cultural and intellectual property, collective authority, culturally restricted knowledge and data sovereignty, which may not be adequately protected by ordinary copyright law.

The default technical ideal should not be “open everything.” UNESCO’s digital-heritage approach recognises access as important, but preservation and access remain subject to privacy and legitimate restrictions. CARE principles further establish that technically reusable data can still be culturally or ethically illegitimate to reuse. ³⁰

Design ethics for a participatory platform

A responsible HCC prototype should provide:

- item-level provenance and uncertainty;
- visible distinction among scientific evidence, historical source, cultural record and heritage claim;
- contributor-selected identity and access settings;
- consent that separates research use, public display, preservation and future reuse;
- withdrawal and correction procedures where technically and legally possible;
- contested annotations rather than a single authoritative emotional label;
- version histories for changing descriptions;
- restricted or tiered access for sensitive materials;
- community-governed vocabularies where appropriate;
- a preservation and closure plan independent of continued researcher involvement.

Engagement metrics should measure interface use, not heritage value. High participation may show curiosity, controversy, strategic promotion or novelty. It does not establish community recognition, cultural transmission or ethical legitimacy.

Theoretical framework and research gap

Framework assessment

Framework	What it explains	What it cannot explain alone	Recommended role
Critical Heritage Studies	How heritage value is socially produced; relations among expertise, institutions, identity and power.	The physical science of warming, psychological measurement or detailed media effects.	Core. Provides the thesis’s controlling anti-essentialist position.

Framework	What it explains	What it cannot explain alone	Recommended role
Authorised Heritage Discourse	How expert and institutional conventions privilege certain materials, aesthetics, histories and authorities.	All institutional activity; institutions are not automatically oppressive, and community claims are not automatically legitimate.	Core sub-framework. Use to examine collecting institutions and scientific authority without dismissing expertise.
Heritagisation	The process by which records and practices become selected, narrated, protected and transmitted as heritage.	Whether the underlying climate claims are scientifically true or whether audiences experienced specific emotions.	Core. Best concept for the project's central question.
Cultural and collective memory	How societies reconstruct the past through media, institutions, rituals and social frameworks.	Direct proof of uniform group memory or heritage status.	Core auxiliary. Particularly useful for reuse, commemoration and transmission.
Affective heritage	How emotions and embodied responses participate in heritage practice and engagement.	A formal category of heritage; psychometric measurement of fear; causal media effects.	Auxiliary, tightly defined. Use as an analytic lens, never as a designation.
Affective publics	How networked communication and shared intensities help publics cohere around events and narratives.	Long-term preservation, heritage recognition or the representativeness of platform users.	Auxiliary for selected social-media or movement cases. Papacharissi's work is relevant to networked storytelling but should not become a theory of heritage. ³¹
Sociology of emotions and affective practice	How emotion is named, performed, regulated, circulated and embedded in social practice.	Meteorological risk, archival value or formal heritage recognition.	Core bridge theory. Prefer affective-practice approaches over treating emotion as an inner substance contained in records. ³²

Framework	What it explains	What it cannot explain alone	Recommended role
Social Amplification of Risk Framework	How communication stations, institutions and social responses may amplify or attenuate risk signals and secondary effects.	Whether amplification is irrational, whether a record is heritage or whether the underlying risk is severe.	Auxiliary. Useful for tracing media circulation and disputes about alarmism. ³³
Risk Society	Large-scale conditions in which modern institutions generate and manage manufactured, transboundary and uncertain risks.	Fine-grained heritage-making, local variation, emotion categories or digital archive design.	Background only. Too macro-level to serve as the principal operational theory.
Climate imaginaries	Collective visions of climate futures, social orders, technologies and ways of life.	Direct evidence of emotion or heritage recognition.	Auxiliary for analysing narratives, art and future-oriented discourse.
Difficult or contested heritage	Enduring conflict over painful pasts, identities, responsibility and public representation.	Ordinary disagreement, transient controversy or generic climate urgency.	Conditional auxiliary. Use only where the case demonstrates inherited difficulty or sustained conflict.
Documentary and digital heritage	Appraisal, provenance, authenticity, preservation, access, obsolescence and enduring documentary value.	Community identity or emotional experience without additional methods.	Core. Essential if the project creates a digital archive.
Participatory heritage	Shared authority, co-curation, community contribution and collaborative interpretation.	Automatic equality, consensus or the legitimacy of every community claim.	Core methodological orientation, not a guarantee of ethical participation.
Archival silences	How power shapes what is recorded, appraised, described, discoverable and forgotten.	What absent actors would necessarily have said.	Core reflexive framework.

Framework	What it explains	What it cannot explain alone	Recommended role
Decolonial heritage	Colonial categories, extraction, epistemic hierarchy, restitution and the politics of universal heritage claims.	A single ready-made protocol for every Indigenous or Global South community.	Core ethical-critical framework if the study makes cross-cultural claims.
Indigenous Data Sovereignty	Collective rights and authority over Indigenous data, knowledge, metadata, access and reuse.	General ethics for all data or permission for outsiders to define the relevant community.	Mandatory governance framework whenever Indigenous data or knowledge is included.

Recommended theoretical architecture

A Master thesis should not attempt to give equal weight to all these traditions. The most coherent architecture is:

Critical Heritage Studies and heritagisation

supported by **documentary/digital heritage**

and connected to emotion through **sociology of emotions and affective practice**.

Cultural memory, archival silences and participatory heritage should support specific research questions. Social Amplification of Risk, affective publics, difficult heritage and climate imaginaries should be invoked only where the selected material demands them.

“Risk Society” is unnecessary as a major framework. It is too broad to help decide whether a questionnaire, meme or heatwave practice has become heritage. Likewise, “affective heritage” should not become an umbrella under which all climate emotions are automatically admitted. Theories should be selected because each performs a distinct explanatory task.

Research gap

The climate-and-heritage literature has been dominated by the physical impacts of climate change on heritage places, collections and conservation, together with adaptation and mitigation. Orr, Richards and Fatorić’s review of 165 publications from 2016–2020 found a growing but geographically uneven field, with strong European representation. Adjacent scholarship examines museum communication, environmental memory and the contribution of heritage to climate adaptation. ³⁴

Climate-emotion scholarship, by contrast, has concentrated on contemporary measurement, psychological experience, youth attitudes and relationships among anxiety, distress and action. Major contributions include climate-emotion taxonomies, anxiety scales and cross-national surveys, but these do not generally ask how the instruments, images, narratives and testimonies themselves are collected, reused and converted into long-term memory resources. ³⁵

The defensible gap is therefore:

There is limited research that longitudinally examines how documentary and digital records of temperature-related public emotion are selected, curated, reused, contested and potentially heritage-valued, while rigorously distinguishing scientific evidence, cultural record, researcher-created archive and socially recognised heritage.

This gap is narrower and more defensible than “no one has studied climate fear as heritage.” Existing scholarship already studies emotion in heritage, environmental memory, climate communication, community archives and digital preservation. The originality lies in integrating them through an explicit heritage-eligibility framework and a bounded empirical case, not in claiming discovery of an entirely new category.

Research design, questions, and scope

Alternative research positions

Position	Academic defensibility	Originality	Master feasibility	HCC, engagement and heritage fit	Principal risk
Conservative: preservation and cultural meaning of documentary and digital records concerning climate threat	High	Moderate	High with a bounded institutional corpus	Strong documentary/digital-heritage and HCC fit; moderate social-emotion contribution	May become conventional collection analysis unless it studies selection, absence and reuse.
Moderate: how public emotions concerning rising temperature are recorded, circulated and heritage-made	High if “emotion” and “heritage-making” are operationalised	High but credible	Medium-high if limited to one place, period and two or three record types	Best overall fit. Supports interviews, archival research, participatory design and critical heritage analysis	Risk of inferring emotion from representation or treating archive creation as recognition.
Radical: a global emotional heritage through which humanity learned to fear warming	Low	Rhetorically high, analytically unstable	Very low	Superficially broad fit but poor methodological coherence	Universalism, Western and English bias, translation failure, heritage inflation and impossible data requirements.

Recommended position: the moderate formulation, constrained by conservative documentary methods.

The radical position should not be adopted as a Master thesis claim. It can survive only as an object of critique: the thesis might ask who invokes “humanity,” “global fear” or universal emergency and whose experiences disappear in those formulations.

Recommended main research question

How are selected records and practices concerning the emotional interpretation of rising temperature collected, reused and contested, and under what social, institutional and temporal conditions do they acquire—or fail to acquire—heritage value?

This question is preferable because it:

- does not assume that fear is present in every object;
- does not assume that the objects are heritage;
- permits positive and negative findings;
- separates recording, circulation and heritage-making;
- allows institutional and community authority to be compared;
- can support a digital prototype without turning the prototype into the thesis’s proof.

Recommended sub-questions

Sub-RQ on semantics

How have temperature, warming, heat, crisis and emergency been connected to distinct categories of fear, worry, anxiety, concern, grief, anger, hope and efficacy within the selected corpus?

Sub-RQ on selection and authority

Which actors select, classify, collect or discard these records, and what forms of scientific, institutional, political or community authority support their decisions?

Sub-RQ on heritage-making

What evidence exists of persistence, repeated reuse, transmission, identity formation, commemoration or preservation, and which prominent records fail the proposed heritagisation test?

Sub-RQ on exclusion and ethics

How do archival silences, language, platform structure, privacy, colonial collecting practices and data sovereignty shape what can be remembered and who can control its future use?

Sub-RQ on HCC

How can a participatory, provenance-aware digital prototype represent uncertain and contested heritage claims without converting contribution, visibility or researcher selection into automatic heritage status?

Recommended subtitle

Fear of Temperature: Public Climate Emotion, Documentary Records and the Making of Heritage in [Place], [Period]

A more cautious alternative is:

Fear of Temperature? Recording, Curating and Contesting Public Emotion around Rising Heat

The question mark is conceptually useful because it signals that “fear” is a proposition to be tested rather than a predetermined essence.

Recommended empirical boundary

For Master-level feasibility, the study should be restricted to:

- **one jurisdiction or metropolitan region**, or at most two tightly matched cases;
- **a ten- to fifteen-year primary period**, with a small historical prehistory rather than an unrestricted history of global warming;
- **two or three material classes**, such as institutional collections, public visualisations and community oral histories;
- **one or two languages** for which the researcher has sufficient competence and can document semantic differences;
- **two or three collecting institutions or community partners**;
- a small participatory prototype rather than a permanent global platform.

An Australia-focused case could be defensible because it offers national climate institutions, distinctive heat exposure, Indigenous data-governance requirements, climate activism and accessible museum, library and archival infrastructures. That location should not be selected merely for convenience, however; the thesis proposal must identify a specific archive, community or institutional conflict that makes the case analytically productive.

Inclusion rules

Material should enter the analytical corpus only when it:

1. explicitly concerns temperature, warming, extreme heat, heatwaves or associated thresholds;
2. contains or has generated an identifiable emotional, risk, memory or heritage interpretation;
3. possesses a documented date, source, creator or custodial context;
4. falls within the defined place, period, language and media categories;
5. can be collected and analysed lawfully and ethically;
6. contributes to testing at least one research question;
7. allows classification as scientific evidence, historical source, cultural record, heritage candidate or recognised heritage;
8. includes enough contextual metadata to avoid misleading reinterpretation.

Exclusion rules

The project should exclude:

- general climate material with no clear relationship to temperature or heat;
- arbitrary collections of dramatic climate images chosen solely for emotional effect;
- scientific data detached from metadata, baselines or methods;
- attempts to diagnose mental illness from media language or online posts;
- claims to represent global public emotion from English-language sources;
- private, deleted or sensitive social-media material lacking defensible authority for preservation;
- Indigenous knowledge lacking appropriate governance and authority to control;
- records included only because they are viral, politically prominent or easy to digitise;
- materials whose rights status makes permanent public display unjustifiable;
- user-engagement metrics offered as evidence of heritage value.

Academic methods

The thesis should combine a limited number of complementary methods:

Archival and collection analysis would reconstruct provenance, appraisal, catalogue language, preservation decisions and institutional mandates.

Longitudinal discourse and visual analysis would examine how temperature and emotion terms are related across selected moments, while avoiding automatic keyword-to-emotion inference.

Reuse tracing would follow selected objects through publication, adaptation, exhibition, education, protest, commemoration and counter-discourse. This is essential because heritage value often appears in an object's afterlife rather than its initial production.

Semi-structured interviews or oral histories with custodians, creators, community participants and users would provide evidence of meaning, identity, recognition and refusal. Oral histories produced by the project should be labelled as newly created records rather than pre-existing heritage.

Participatory HCC design could test how users interpret provenance, uncertainty, emotional categories and contested claims. Evaluation should examine interpretive accuracy, perceived legitimacy, contributor control and visibility of disagreement—not merely usability or time on site.

Negative-case analysis should compare objects that look heritage-like but have not been preserved, transmitted or recognised. This guards against circular reasoning.

A modest corpus—rather than a comprehensive global database—is the appropriate Master strategy. The platform should demonstrate the classification and governance model through a small number of richly documented items. It should not attempt to become the definitive archive of global climate emotion.

High-risk language to avoid

The thesis should not state:

- “Fear is cultural heritage.”

- “Climate anxiety is humanity’s shared heritage.”
- “Humanity learned to fear temperature.”
- “This archive preserves global climate fear.”
- “The world is experiencing climate panic.”
- “Concern about warming is an anxiety disorder.”
- “Viral climate images are digital heritage.”
- “The first global archive of emotional climate heritage.”
- “Indigenous climate memories” as a collectable category without naming the relevant peoples and governance.
- “Community-recognised” when recognition was generated only in a research workshop.

Acceptable formulations include “records of expressed concern,” “representations of threat,” “reported anxiety,” “emotional repertoires,” “heritage candidate,” “emerging heritage claim,” “research-created collection” and “evidence of heritage-making.”

Annotated bibliography and final feasibility decision

Formal heritage, museum and archival frameworks

UNESCO. 2003. *Convention for the Safeguarding of the Intangible Cultural Heritage*. UNESCO. Stable official source.

Supports the definition of intangible heritage as practices, representations, expressions, knowledge and skills recognised by communities, groups and individuals and transmitted through time. It is the strongest formal reason not to call an abstract emotion ICH without evidence of social recognition, recreation and transmission. ¹¹

UNESCO. 2015. *Recommendation Concerning the Preservation of, and Access to, Documentary Heritage Including in Digital Form*. UNESCO. Stable official source.

Supports the distinction between ordinary documents and documentary heritage of enduring significance. It provides the project’s principal policy basis for appraisal, preservation, accessibility and reuse of reports, surveys, audiovisual records and digital collections. ³⁶

UNESCO. 2003. *Charter on the Preservation of Digital Heritage*. UNESCO. Stable official source.

Supports selective long-term preservation of digitally born resources and recognition that digital heritage can arise in every language and area of knowledge. It also establishes that access, continuity and preservation planning are central; merely placing content online is insufficient. ³⁷

UNESCO. 2002. *Memory of the World: General Guidelines to Safeguard Documentary Heritage*. UNESCO. Stable official source.

Supports appraisal through significance, authenticity, integrity, rarity and risk, and emphasises ethical issues in preservation and access. Useful for designing selection and provenance criteria. ³⁸

Council of Europe. 2005. *Framework Convention on the Value of Cultural Heritage for Society, or Faro Convention*. Council of Europe. Stable official source.

Supports a value-centred and participatory conception of heritage in which meanings and uses attached by people are more important than intrinsic object status. The heritage-community concept supports investigation of who wishes to sustain and transmit particular records. ³⁹

International Council of Museums. 2022. *Museum Definition*. ICOM. Stable official source.

Supports the treatment of museums as permanent institutions that research, collect, conserve, interpret and exhibit tangible and intangible heritage while operating ethically, inclusively and with

community participation. Useful for evaluating institutional recognition without reducing heritage to institutional custody. ⁴⁰

International Council on Archives. 2011. *Universal Declaration on Archives*. ICA. Stable institutional source.

Supports the role of archives in preserving unique and irreplaceable records, accountability, memory and intergenerational transmission. It is relevant to the distinction between record creation, archival appraisal and heritage recognition. ⁴¹

UNESCO/PERSIST and IFLA. 2021. *The UNESCO/PERSIST Guidelines for the Selection of Digital Heritage for Long-Term Preservation*. UNESCO and IFLA. Stable institutional source.

Supports explicit selection rather than indiscriminate saving. It is especially relevant to websites, social media, datasets, software, visualisations and other digital climate materials whose preservation costs and dependencies require appraisal. ⁴²

Critical heritage and heritage-making

Smith, Laurajane. 2006. *Uses of Heritage*. Routledge. DOI: 10.4324/9780203602263.

Provides the core argument that heritage is a cultural performance of meaning-making rather than an inherent property of things. Introduces the Authorised Heritage Discourse and supports the thesis's refusal to equate archive content with heritage. ⁴³

Smith, Laurajane. 2012. "Discourses of Heritage: Implications for Archaeological Community Practice." *Nuevo Mundo Mundos Nuevos*. Stable journal source.

Extends the critique of Western and Eurocentric authorised heritage discourse. Supports analysis of how institutions and experts may privilege monumental, Western and professional forms of value over community practices and non-Western knowledge. ⁴⁴

Smith, Laurajane, and Emma Waterton. 2012. "Constrained by Commonsense: The Authorised Heritage Discourse in Contemporary Debates." *Oxford University Press/International Journal of Heritage Studies-related publication record*. Stable institutional source.

Supports examination of how apparently self-evident professional assumptions constrain what can be recognised as heritage. Useful for analysing institutional climate collections and exclusions. ⁴⁵

Harrison, Rodney. 2013. *Heritage: Critical Approaches*. Routledge. Stable publisher source.

Provides a broad critical account of heritage as an assemblage of practices, institutions, materials and future-making activities. Useful for situating prospective collecting and contemporary heritage-making without claiming that everything preserved is heritage. ⁴⁶

Stobiecka, Monika. 2021. "Heritagisation: Or When Everything Becomes Heritage." *Historyka. Studia Metodologiczne*, 51. DOI: 10.24425/hsm.2021.138370.

Directly supports the critique of heritage inflation. It should frame the project's negative tests and its distinction among historical evidence, cultural record and heritage. ⁴⁷

Macdonald, Sharon. 2009. *Difficult Heritage: Negotiating the Nazi Past in Nuremberg and Beyond*. Routledge. Stable publisher source.

Provides the standard foundation for difficult heritage as a socially troubling inheritance, not simply emotionally unpleasant material. It helps prevent casual use of "difficult heritage" for any alarming climate record. ¹²

Waterton, Emma, and Steve Watson, eds. 2015. *The Palgrave Handbook of Contemporary Heritage Research*. Palgrave Macmillan. Stable publisher source.

Provides broad coverage of contemporary critical, participatory and political approaches to heritage. Useful for positioning the thesis across institutional and community processes rather than within collection description alone.

Affect, emotion and memory

Wetherell, Margaret. 2012. *Affect and Emotion: A New Social Science Understanding*. Sage. Stable publisher source.

Develops the concept of affective practice, linking embodied feeling, discourse and social activity. It supports analysis of emotion as socially organised practice without reducing it to either private psychology or free-floating cultural atmosphere. 48

Wetherell, Margaret. 2013. "Affect and Discourse—What's the Problem? From Affect as Excess to Affective/Discursive Practice." *Subjectivity*. Stable journal source.

Supports a method that analyses emotional language and situated practice together. Particularly useful for avoiding unsupported claims that visual or textual records contain a determinate audience emotion. 49

Wetherell, Margaret, Laurajane Smith, and Gary Campbell. 2018. "Introduction: Affective Heritage Practices." In *Emotion, Affective Practices, and the Past in the Present*. Routledge. DOI: 10.4324/9781351250962-1.

Provides the principal academic basis for "affective heritage" as an analytical approach to emotion in heritage practice. It does not establish affective heritage as an official category. 13

Rana, Jasmijn, Hester Dibbits, and Marlous Willemsen. 2017. "Moved by the Tears of Others: Emotion Networking in the Heritage Sphere." *International Journal of Heritage Studies*. DOI: 10.1080/13527258.2017.1362581.

Supports participatory methods that map differing emotional positions around heritage rather than forcing consensus. Potentially useful for workshops in which users annotate contested climate records. 50

Halbwachs, Maurice. 1992 [1950]. *On Collective Memory*. University of Chicago Press. Stable publisher source.

Provides the sociological foundation for understanding memory as reconstructed within social frameworks. Supports the thesis's focus on institutions, groups and communicative contexts rather than a universal global memory. 15

Assmann, Jan. 2008. "Communicative and Cultural Memory." In *Cultural Memory Studies*. De Gruyter. Stable publisher source.

Distinguishes everyday communicative memory from more durable, institutionally and symbolically organised cultural memory. Useful for testing temporal persistence and intergenerational transmission. 14

Papacharissi, Zizi. 2015. *Affective Publics: Sentiment, Technology, and Politics*. Oxford University Press. DOI: 10.1093/acprof:oso/9780199999736.001.0001.

Explains how networked storytelling and affective intensity can help publics form and act. Useful for hashtags and social movements, but insufficient for establishing long-term heritage value. 31

Climate emotions, risk and communication

Pihkala, Panu. 2022. "Toward a Taxonomy of Climate Emotions." *Frontiers in Climate*, 3:738154. DOI: 10.3389/fclim.2021.738154.

Provides the strongest source for differentiating climate anxiety, grief, anger, guilt, hope and related emotional processes. Supports the requirement that these constructs not be collapsed into fear. ⁵¹

Clayton, Susan, and Bryan T. Karazsia. 2020. "Development and Validation of a Measure of Climate Change Anxiety." *Journal of Environmental Psychology*, 69:101434. DOI: 10.1016/j.jenvp.2020.101434.

Introduces a major climate-change anxiety scale and distinguishes cognitive-emotional impairment and functional effects. Useful both as a measurement source and as an object in the history of climate-emotion categorisation. ⁵²

Hogg, Teaghan L., Samantha K. Stanley, Léan V. O'Brien, Marc S. Wilson, and Cameron R. Watsford. 2021. "The Hogg Eco-Anxiety Scale: Development and Validation of a Multidimensional Scale." *Global Environmental Change*, 71:102391. DOI: 10.1016/j.gloenvcha.2021.102391.

Demonstrates that eco-anxiety can involve affective symptoms, rumination, behavioural effects and anxiety about personal environmental impact. Supports the distinction between eco-anxiety and climate-specific anxiety. ⁵³

Hickman, Caroline, Elizabeth Marks, Panu Pihkala, Susan Clayton, R. Eric Lewandowski, Elouise E. Mayall, et al. 2021. "Climate Anxiety in Children and Young People and Their Beliefs about Government Responses to Climate Change: A Global Survey." *The Lancet Planetary Health*, 5, e863–e873. DOI: 10.1016/S2542-5196(21)00278-3.

Provides influential cross-national evidence concerning youth climate worry and perceived government failure. It also illustrates methodological and interpretive issues in making "global" claims from translated survey categories. ⁵⁴

Cunsolo Willox, Ashlee, and Neville R. Ellis. 2018. "Ecological Grief as a Mental Health Response to Climate Change-Related Loss." *Nature Climate Change*, 8, 275–281. DOI: 10.1038/s41558-018-0092-2.

Supports ecological grief as a response to experienced and anticipated ecological loss. It broadens the project beyond fear and connects affect to place, livelihood and identity. ⁵⁵

Cunsolo, Ashlee, Sherilee L. Harper, Kelton Minor, Katie Hayes, Kimberly G. Williams, and Courtney Howard. 2020. "Ecological Grief and Anxiety: The Start of a Healthy Response to Climate Change?" *The Lancet Planetary Health*, 4, e261–e263. DOI: 10.1016/S2542-5196(20)30144-3.

Supports the warning that climate anxiety and grief should not automatically be pathologised; they can be proportionate responses to genuine danger and loss. ⁵⁶

Ojala, Maria. 2012. "Hope and Climate Change: The Importance of Hope for Environmental Engagement among Young People." *Environmental Education Research*, 18. DOI: 10.1080/13504622.2011.637157.

Differentiates constructive hope from denial-based optimism and supports analysis of hope and efficacy alongside threat. It prevents a binary fear-versus-hope model. ⁵⁷

Kasperson, Roger E., Ortwin Renn, Paul Slovic, Halina S. Brown, Jacque Emel, Robert Goble, Jeanne X. Kasperson, and Samuel Ratick. 1988. "The Social Amplification of Risk: A Conceptual Framework." *Risk Analysis*, 8. DOI: 10.1111/j.1539-6924.1988.tb01168.x.

Provides a framework for analysing how institutions, media and social interaction amplify or attenuate

risk signals. It is useful for studying circulation without presuming that amplification means irrational alarm. ⁵⁸

Kasperson, Roger E., et al. 2022. "The Social Amplification of Risk Framework: New Perspectives." *Risk Analysis*. DOI: 10.1111/risa.13926.

Updates the framework and supports examination of contemporary digital and institutional risk communication. It can help analyse secondary social effects while leaving heritage evaluation to separate criteria. ⁵⁹

van der Linden, Sander. 2017. "Determinants and Measurement of Climate Change Risk Perception, Worry, and Concern." *Oxford Research Encyclopedia of Climate Science*. DOI: 10.1093/acrefore/9780190228620.013.318.

Supports separation of risk perception, worry and concern and provides a basis for analysing social, cognitive, experiential and cultural influences on climate-risk judgement. ⁶⁰

McHugh, Lucy H., Lorraine Whitmarsh, Poortinga Wouter, et al. 2021. "Risk? Crisis? Emergency? Implications of the New Climate Emergency Framing for Governance and Policy." *WIREs Climate Change*. DOI: 10.1002/wcc.736.

Provides a focused analysis of "climate emergency" as a framing transition rather than a neutral synonym for climate change. Supports research into declarations, language and political consequences. ⁶¹

Guenther, Lars, et al. 2024. "Framing as a Bridging Concept for Climate Change Communication: A Systematic Review." *Communication Research*. DOI: 10.1177/00936502221137165.

Supports systematic comparison of how climate issues are framed across communication research. Useful for distinguishing frames such as risk, crisis, emergency, conflict and efficacy. ⁶²

Tannenbaum, Melanie B., et al. 2015. "Appealing to Fear: A Meta-Analysis of Fear Appeal Effectiveness and Theories." *Psychological Bulletin*, 141, 1178–1204. DOI: 10.1037/a0039729.

Provides evidence that fear appeals cannot be evaluated simply as either effective or harmful; outcomes depend on message and audience conditions. Supports inclusion of efficacy and response options in platform design. ⁶³

Biggsby, Elisabeth, and Dolores Albarracín. 2022. "Self- and Response Efficacy Information in Fear Appeals: A Meta-Analysis." *Journal of Communication*. DOI: 10.1093/joc/jqab048.

Supports the analytical separation of perceived threat from beliefs that an individual or collective response is possible and effective. ⁶⁴

Climate heritage, visualisation and environmental humanities

Orr, Scott Allan, Julie Richards, and Sandra Fatorić. 2021. "Climate Change and Cultural Heritage: A Systematic Literature Review, 2016–2020." *The Historic Environment: Policy & Practice*, 12, 434–477. DOI: 10.1080/17567505.2021.1957264.

Maps the climate-heritage field and documents its dominant concern with impacts, management, mitigation and adaptation, as well as its European geographical bias. It provides the principal evidence for the proposed research gap. ⁶⁵

Sesana, Elena, et al. 2021. "Climate Change Impacts on Cultural Heritage: A Literature Review." *WIREs Climate Change*. DOI: 10.1002/wcc.710.

Synthesises physical hazards and impacts on tangible heritage. Useful as a boundary source: the

proposed thesis concerns heritage-making around climate records rather than primarily damage to heritage sites. ⁶⁶

Robin, Libby. 2018. "Environmental Humanities and Climate Change: Understanding Humans Geologically and Other Life Forms Ethically." *WIREs Climate Change*. DOI: 10.1002/wcc.499.

Supports analysis of climate change as a cultural, historical and ethical problem rather than only a physical-science issue. It offers environmental-humanities context without determining heritage status.

⁶⁷

Hawkins, Ed. 2025. "Warming Stripes: Representing Global Temperature Change as a Simple Visual." *Bulletin of the American Meteorological Society*. DOI: 10.1175/BAMS-D-24-0212.1.

Documents the design and circulation of warming stripes. It is a key candidate case for studying the transition from scientific visualisation to widely reused cultural symbol while resisting the inference that popularity alone equals heritage. ⁶⁸

National Aeronautics and Space Administration. "Climate Spiral." NASA Scientific Visualization Studio. Stable institutional source.

Provides a prominent example of animated global-temperature visualisation and its scientific provenance. Suitable for comparative reuse and preservation analysis. ⁶⁹

Participation, archives and data governance

Caswell, Michelle, Marika Cifor, and Mario H. Ramirez. 2017. "To Suddenly Discover Yourself Existing: Uncovering the Impact of Community Archives." *The American Archivist/D-Lib-related open publication record*. Stable source.

Supports community archives as sites of representation, belonging, accountability and resistance to dominant archival absence. It also supports evaluating impact through community experience rather than collection size alone. ⁷⁰

Gilliland, Anne J., Sue McKemmish, and Andrew J. Lau, eds. 2017/2019. *Research in the Archival Multiverse* and related participatory-archives scholarship. Monash University Publishing/Facet. Stable publisher sources.

Provides methodological foundations for plural provenance, participatory description, community authority and archival systems that accommodate multiple recordkeeping traditions.

Carroll, Stephanie Russo, Ibrahim Garba, Oscar L. Figueroa-Rodríguez, Jarita Holbrook, Raymond Lovett, Simeon Materechera, Mark Parsons, et al. 2020. "The CARE Principles for Indigenous Data Governance." *Data Science Journal*, 19:43. DOI: 10.5334/dsj-2020-043.

Establishes Collective Benefit, Authority to Control, Responsibility and Ethics as requirements for Indigenous data governance. It is mandatory for any inclusion of Indigenous climate knowledge, memory or community data. ⁷¹

Shvartzshnaider, Yan, et al. 2019. "Learning Privacy Expectations by Crowdsourcing Contextual Informational Norms." *Proceedings of HCOMP*. DOI: 10.1609/hcomp.v7i1.5266.

Operationalises contextual integrity by examining expectations about who may share what information, with whom and under what conditions. Useful for social-media and participatory-platform ethics. ⁷²

Wessell, Adele, and Kirsten Thorpe. 2023. "Archives Above Water: Climate Action, Community Archives and Archival Futures." *Archival Science*. DOI: 10.1007/s10502-023-09424-8.

Provides a practical connection among archives, communities and climate action. Useful for evaluating

whether climate-related archival work supports community agency rather than only institutional preservation. 73

National Oceanic and Atmospheric Administration. *Voices Oral History Archives*. NOAA. Stable institutional source.

Offers a practical precedent for preserving first-person testimony concerning environmental, coastal and scientific experience. It demonstrates the value of oral-history collections while also highlighting the need to distinguish project-created testimony from pre-existing living heritage. 74

Final feasibility decision

Final decision: the project is eligible to continue to a second-round data-feasibility study only under the following conditions.

The object must be reframed. The proposal must define its object as records, representations and practices through which rising temperature is emotionally interpreted and potentially heritage-made. It must not define fear itself as heritage.

The empirical scope must be bounded. A single jurisdiction or region, a defined period, one or two languages and no more than three principal material classes should be specified before data collection.

At least one external heritage-making constituency must be identifiable. The second round must locate a community, movement, family, professional body or collecting institution that already values, preserves, reuses or debates the relevant material. A corpus assembled only by the researcher is insufficient.

The corpus must include negative cases. The research must test why some prominent records remain scientific evidence or transient communication rather than heritage. Without negative cases, the heritagisation argument becomes circular.

Emotion must be operationally differentiated. Fear, worry, concern, anxiety, distress, risk perception, salience, alarmism, grief, anger, hope and efficacy must have separate coding rules. Media language cannot be treated as proof of audience emotion.

Hazard and representation must remain analytically separate. Scientific evidence should establish what temperature and climate claims mean; heritage and communication analysis should examine how those claims are represented, remembered and used.

The platform must be subordinate to the thesis. It should function as a provenance-aware research prototype that displays disputed classifications. Its creation, traffic and participation rates must not be presented as evidence that heritage exists.

Rights and preservation feasibility must be demonstrated. The second round should confirm access, provenance, copyright, consent and long-term deposit arrangements for at least two realistic collections before the thesis promises a public archive.

Indigenous inclusion requires Indigenous governance. If Indigenous knowledge, testimony or data are contemplated, the project cannot proceed on ordinary institutional ethics approval alone. Relevant Indigenous authorities must have control over inclusion, metadata, access, benefit, reuse and withdrawal.

Any claim beyond the Anglosphere requires a multilingual method. Translation, emic emotion categories and cross-cultural construct validity must be incorporated. Otherwise, all claims must be explicitly limited to the selected language and institutional field.

Failure to satisfy the first, third, fifth, eighth or ninth condition should convert the project to **NO-GO in its current form**. Failure to satisfy the remaining conditions should require further narrowing before data collection.

Under these constraints, *Fear of Temperature* can become a rigorous Master thesis on the boundary among climate evidence, public emotion, documentary practice and heritage-making. Without them, it would most likely become a thematically curated climate-communication website that retrospectively labels its own collection as heritage.
